INTRODUCTION

The following document is the template for the REST API documentation.

RESOURCE MODEL

Managed Entity and Task Resource Models

For every single resource managed by the API provide a JSON based representation of the managed entities and tasks.

The PM API is partially an entity-centric interface as it provides services on the 3 main resources of the ABEs:

- MeasurementProductionJob
- MeasurementCollectionJob
- AdhocCollection

The picture below presents an overall view of the Information Model of the Performance Management Monitoring Interface:

MEASUREMENTCOLLECTIONJOB

A Measurement Collection Job is used to control the periodic collection of performance indicators, implemented as a sub-entity of the PM Measurement Job.

A PM measurement job is the administrative entity defined by a client application to perform a periodic activity related to PM data. The PM activities may be production of

measurements, collection of measurements or PM objective monitoring (scheduled evaluation of thresholds).

In each of these cases, the PM measurement job will include the following:

- A set of requested performance indicators
- A network/service scope defining a subset of the network or a subset of the service catalog
- Scheduling parameters
- Specific activity parameters, related to collection, production or objective monitoring

Below is the JSON Resource Model for “measurementCollectionJob”.

MEASUREMENTPRODUCTIONJOB

Performance measurements production functionality is about controlling the generation of indicators, the equivalent of PM Control in MTOSI. Production instructions are usually set in the set-up of a PM project. Changes are usually required for new versions of network elements or other kinds of network changes.

The PM Production Interface Service supports two flavors of operations:

- Production only
- Production and Collection - A mode that supports the creation and the deletion of both PM Production and PM Collection, similarly to some of the existing standards (3GPP, OSS/J)

ADHOCCOLLECTION

Ad-hoc collection is an on-demand collection method of Performance measurements results from a consuming application, requesting spontaneously a set of data for a set of network or service testing resources for a given temporal context. As the ad-hoc query is a single isolated request, its lifecycle is much simpler and isolated, having a request-response nature.

A PM query for collecting performance indicators of a certain time range. AdhocCollections have no schedule.

Below is the JSON Resource Model for “adhocCollection”.

```

    "id": "adhocJob001",

TRACKINGRECORD

The measurement job has associated tracking record objects to log and audit the lifecycle of the measurement job.

Allows the tracking of modifications on the measurement job.

The tracking records should not be returned by default with the measurement job to allow retrieving the job without the tracking records. Whether the tracking records are stored with the measurement job or outside of it is implementation specific.

Below is the JSON Resource Model for “trackingRecord”.

```

PERFORMANCE GROUP AND INDICATOR

A Performance Indicator Specification holds the definition of the requested Performance indicator including its name, value type, collection type, description and units.

A Performance Indicator Group is a set of performance indicators that are reported as a group by an Element Manager or a Network Element. Other common terms in the industry are Counter Set or Counter Group.

A Performance Indicator Group Specification is the logical group of the Performance Indicator Specification objects that compose a Performance Indicator Group. The Performance Indicator Group Specification has a name (string) and it can (optionally) hold the individual performance indicator specification objects.

A Measurement Job, at the base entity level, can define its scope of requested indicators in one of two ways:

- By specifying a list of performance indicator group specification objects. This will be more common for some technologies such as Mobile and IP. In some cases, interfaces may even use just the indicator group names without using the underlying indicators. For these cases, it is assumed that the underlying indicator specifications are standard and agreed on by both parties of the interface.
- By specifying a list of specific performance indicator specification objects. This may be used for cases where equipment vendors do not support performance indicator groups or for service layer indicators where the performance indicator groups may not exist.

STATE MACHINE FOR ADMIN STATE & EXECUTION STATE

There are two state variables for each of the three jobs.

ADMIN JOB STATE MACHINE:

Possible states are LOCKED and UNLOCKED. The default value when any job is created it shall be UNLOCKED. The operation Resume (PATCH) shall put the admin state to UNLOCKED. And the operation Suspend (PATCH) shall put the admin state to LOCKED.

PRODUCTION JOB STATE MACHINE WITH SCHEDULE

The following diagram depicts the state machine and notifications for a Performance Measurement Production Job with an attached schedule.

PRODUCTION JOB STATE MACHINE WITHOUT SCHEDULE

COLLECTION JOB STATE MACHINE WITH SCHEDULE

The following diagram depicts the state machine and notifications for a Performance Measurement Collection Job with an attached schedule.

COLLECTION JOB STATE MACHINE WITHOUT SCHEDULE

Notification Resource Models

For every single event supported by the API provide a JSON based representation of the managed event.

You can start with an XML representation but remember that the default representation will be JSON.

Remember that the Pub/Sub models are common and described in the TMF REST Design Guidelines.

For example the SMAPI 2.0 use the following Management Report Event representation:

FILESREADY

MeasurementCollectionJobService and AdhocCollectionService shall emit the notification “filesReady”, when the file has been generated.

```
{  
  "event": {  
    "id": "1",  
    "compressionType": "NO_COMPRESSION",  
    "packingType": "NO_PACKING",  
    "fileInfo": {

    },  
    "fileTransferStatus": "COMPLETE"  
  },  
  "eventType": "FilesReady"  
}
```

FILESPREPARATIONERROR

MeasurementCollectionJobService and AdhocCollectionService shall emit the notification “filesPreparationError”, when the file cannot be generated due to any reason.

```
{  
  "event": {  
    "id": "1",  
    "compressionType": "NO_COMPRESSION",  
    "packingType": "NO_PACKING",  
    "fileInfo": {

      "readyTime": "11-26-2014 16:30:00 +0530"  
    },  
    "reason": " filePreparationErrorReason ",

API NOTIFICATION TEMPLATES

For every single of operation on the entities use the following templates and provide sample REST notification POST calls.

It is assumed that the Pub/Sub uses the Register and UnRegister mechanisms described in the REST Guidelines reproduced below.

REGISTER LISTENER POST /HUB

Description :

Sets the communication endpoint address the service instance must use to deliver information about its health state, execution state, failures and metrics. Subsequent POST calls will be rejected by the service if it does not support multiple listeners. In this case DELETE /api/hub/{id} must be called before an endpoint can be created again.

Behavior :

Returns HTTP/1.1 status code 204 if the request was successful.

Returns HTTP/1.1 status code 409 if request is not successful.

REQUEST
POST /api/hub Accept: application/json {"callback": "http://in.listener.com"}
RESPONSE
201 Content-Type: application/json Location: /api/hub/42 {"id": "42", "callback": "http://in.listener.com", "query": null}

UNREGISTER LISTENER DELETE HUB/{ID}

Description :

Clears the communication endpoint address that was set by creating the Hub.

Behavior :

Returns HTTP/1.1 status code 204 if the request was successful.

Returns HTTP/1.1 status code 404 if the resource is not found.

REQUEST
DELETE /api/hub/{id} Accept: application/json
RESPONSE
