TMF653B Service Test Management API Conformance Profile v4.0.0

The Service Test API provides a standardized mechanism for placing a service test with all the necessary test parameters. The API consists of a simple set of operations that interact with CRM/Service Management systems in a consistent manner. A service test is a procedure intended to check the quality, performance, or reliability of a service.

Service Test Management API manages service test resource and service specification test resource:

-        A service test specification describes the service test in terms of parameters to be configured and measures to be taken.

-        A service exists for a controlled test invocation on a service. The service test is executed according to a schedule. and contains service test configuration parameters that are to be applied at execution time, and service test measures that result.

Team Approved Date: 02-Oct-2020

Release Status: Pre-production	Approval Status: Team Approved
Version: 4.0.0	IPR Mode: RAND
