TMF622 Product Ordering Management API REST Specification R16.5.1

The Product Ordering Management API provides a standardized mechanism for placing a product order with all of the necessary order parameters. The API consists of a simple set of operations that interact with CRM/Order negotiation systems in a consistent manner. A product order is created based on a product offering that is defined in a catalog. The product offering identifies the product or set of products that are available to a customer, and includes characteristics such as pricing, product options and market.

Modifications in this release are as follows:

- Added price and priceAlteration entities to define the price and discount during the order process.
- A product could be delivered at different places. So, added an array of places.
- In product order lifecycle, added the status change from "Acknowledged" value to "Pending" value.
