TMF647 Address API REST Specification R16.0.1

This document is the specification of the REST API for geographic address management. It includes the model definition as well as all available operations.

The Address API provides a standardized client interface to an Address management system.

It allows to look for worldwide addresses.

It can also be used to validate address data, to be sure that it corresponds to a real address.

Finally, it can be used to look for an address by: searching an area as a start (city, town, …), then zooming on the streets of this area, and finally listing all the street segments (numbers) in a street.
